Isaac Hernandez

Founder & Studio Lead | Agentic Systems Engineer

📍 Remote 🌐 doesthisfeelright.com 💻 github.com/doesitfeelright/does-this-feel-right-

> Founder of **Does This Feel Right?**, a frontier studio pioneering **Agentic Systems Engineering**—the discipline of building opinionated operating systems for hybrid human-AI teams. I design and orchestrate agent-native workflows, decision governance protocols, and verifiable AI systems that make small teams unusually effective. My work sits at the intersection of AI engineering, computational organization theory, and human-AI collaboration, creating living systems that prove their reliability through immutable decision ledgers.

PROFESSIONAL EXPERIENCE

Founder & Studio Lead

2024 - Present

Does This Feel Right? (Studio OS)

Remote

- Founded and operate a frontier studio that runs on its own **Studio OS Protocol**—a forkable, verifiable specification for agentic governance
- Architected and deployed a **Frontier Team** of specialized AI agents (Architect, Alchemist, Librarian, Operator) that handle research, content generation, system design, and deployment workflows
- Developed **Studio OS Copilot**, a universal decision-capture and agent-governance layer that integrates across browser, mobile, IDE, and hardware surfaces
- Built multi-agent orchestration systems using Google Gemini, OpenAI, and Anthropic APIs with custom workflow automation and guardrails
- Designed and implemented **verifiable decision logging** systems with on-chain governance capabilities for trustless verification of agent actions
- Created comprehensive AI engineering research lab publishing reproducible experiments on model performance, latency, error rates, and alignment drift
- Developed custom static site generation system with AI-powered content pipeline, terminal-based admin interface (Textual), and automated CI/CD deployment
- Established studio as a living reference implementation for AI-native organization design, demonstrating patterns for agent architecture, human-AI collaboration loops, and computational organization theory

AI Systems Architect & Engineer

2023 - 2024

Independent Projects

Remote

- Designed and built **agentic workflow systems** integrating multiple LLM providers (Gemini, GPT-4, Claude) with custom orchestration logic
- Developed browser extensions and mobile interfaces for real-time decision capture and agent interaction
- Created automated content generation pipelines with quality guardrails and human-in-the-loop verification
- Built distributed AI architecture spanning Mac, Windows, and cloud nodes with WebSocket-based real-time communication
- Implemented comprehensive testing frameworks and security scanning for AI-powered applications

CORE COMPETENCIES

AGENTIC SYSTEMS

- Multi-agent orchestration
- Agent architecture design
- Workflow automation
- Decision governance
- Guardrail implementation

AI ENGINEERING

- Google Gemini API
- OpenAI GPT-4
- Anthropic Claude
- Prompt engineering
- Model evaluation

DEVELOPMENT

- Python (FastAPI, Flask)
- JavaScript/Node.js
- React & modern frontend
- WebSocket & real-time
- Browser extensions

ARCHITECTURE

- System design
- API design
- Distributed systems
- Event-driven architecture
- Microservices

DEVOPS & TOOLS

- GitHub Actions CI/CD
- Docker & containerization
- Security scanning
- Automated testing
- Git workflow

GOVERNANCE & QUALITY

- AI alignment monitoring
- Verifiable logging
- Decision auditing
- System telemetry
- Quality metrics

PRODUCTS & INITIATIVES

- **Studio OS Protocol:** Open protocol for agent governance with immutable decision logging and verifiable guardrails
- **Autonomous System Designer:** Dev tool that ingests codebases and generates tailored Studio OS implementations with agents, workflows, and metrics
- **Agentic OS Bootcamp:** 4-week intensive program teaching engineers to build production-ready agentic operating systems
- **Frontier Team as a Service:** Embedded agent pods delivering real-world decisions and code directly into client workflows
- **Frontier Console:** Distributed edge device for local agent inference with offline decision logging for regulated industries
- **Studio OS Copilot:** Universal decision-capture interface spanning browser, mobile, IDE, and hardware with "Does this feel right?" feedback loops

TECHNICAL EXPERTISE

- **Agentic Systems Engineering:** Formal discipline combining AI engineering, human-AI collaboration, computational organization theory, and AI governance
- **Decision Architecture:** Designing decision-making loops where humans and agents share responsibility with clear policies for autonomy vs. human judgment
- **Verifiable Intelligence:** Implementing cryptographically verifiable decision logs and on-chain governance for trustless agent verification
- **Self-Evolving Systems:** Building systems that propose their own improvements based on failure/override data and compound authority over time
- **Observable Systems:** Creating intelligible, high-leverage systems with comprehensive telemetry and minimal non-vanity metrics

PHILOSOPHY & APPROACH

- Build systems that "feel right" to users, builders, and business metrics—not just technically correct
- Treat the studio as its first and most important client; patterns that don't survive real internal use don't become external offerings
- Focus on studio-sized agility and taste over enterprise-scale complexity and compliance dashboards
- Prioritize observable, forkable, and verifiable systems over opaque black boxes
- Design for long-term control and leverage, not performative "AI transformation"
